

Car Price Prediction

The focus of this project is developing a machine learning model using python that can accurately predict the price of used car based on the dataset features in order to make informed purchases. This project is built on Linear and Lasso Regression model.

Abstract and Scope (should not exceed 1 page)

The focus of this project is developing a machine learning model using python that can accurately predict the price of used car based on the dataset features like brand, year, sold price, present price, KMS driven, fuel type, transmission type and owners, in order to make informed purchases. This project is built on Linear and Lasso Regression model.

- > Can cope up with price volatility
- > Can analyze multiple sources at a time
- > Improves the accuracy of price predictions
- > Improves profit margin
- > Industrial sectors like retail, marketing, automotive and stock picking benefit the most.

Feasibility Study:

The data is pre-processed after it is collected. Once the data is processed it is split into training data and test data (Train test split). This is then fed into Linear and Lasso Regression model to compare the error percentage or the accuracy score. After this we have Trained Linear and Lasso Regression model to which the new data can be fed and the car price can be predicted.

Design Approach/ Methodology/ Planning of work (should not exceed 1 page)

The data is pre-processed after it is collected. Once the data is processed it is split into training data and test data (Train test split). This is then fed into Linear and Lasso Regression model to compare the error percentage or the accuracy score. After this we have Trained Linear and Lasso Regression model to which the new data can be fed and the car price can be predicted.

This project uses train and test model to split the selected data base into train and test data to estimate the performance. Further by using test set we determine if the model is underfitting or overfitting the data. After this the split data is fed into Linear and Lasso regression model to compare the error percentage or the accuracy score. Now we have trained linear and Lasso regression model to which the new data can be fed and the car price can be predicted.
